

Домашнее задание по курсу ММО

Васильев А.Р. ИУ5-24М

Шаги выполнения ДЗ:

- 1) Поиск и выбор набора данных для построения моделей машинного обучения. На основе выбранного набора данных студент должен построить модели машинного обучения для решения или задачи классификации, или задачи регрессии.
- 2) Проведение разведочного анализа данных. Построение графиков, необходимых для понимания структуры данных. Анализ и заполнение пропусков в данных.
- 3) Выбор признаков, подходящих для построения моделей. Кодирование категориальных признаков Масштабирование данных. Формирование вспомогательных признаков, улучшающих качество моделей.
- 4) Проведение корреляционного анализа данных. Формирование промежуточных выводов о возможности построения моделей машинного обучения. В зависимости от набора данных, порядок выполнения пунктов 2, 3, 4 может быть изменен.
- 5) Выбор метрик для последующей оценки качества моделей. Необходимо выбрать не менее двух метрик и обосновать выбор.
- 6) Выбор наиболее подходящих моделей для решения задачи классификации или регрессии. Необходимо использовать не менее трех моделей, хотя бы одна из которых должна быть ансамблевой.
- 7) Формирование обучающей и тестовой выборок на основе исходного набора данных. Построение базового решения (baseline) для выбранных моделей без подбора гиперпараметров. Производится обучение моделей на основе обучающей выборки и оценка качества моделей на основе тестовой выборки.
- 8) Подбор гиперпараметров для выбранных моделей. Рекомендуется подбирать не более 1-2 гиперпараметров. Рекомендуется использовать методы кросс-валидации. В зависимости от используемой библиотеки можно применять функцию GridSearchCV, использовать перебор параметров в цикле, или использовать другие методы.
- 9) Повторение пункта 8 для найденных оптимальных значений гиперпараметров.
- 10) Сравнение качества полученных моделей с качеством baseline-моделей.
- 11) Формирование выводов о качестве построенных моделей на основе выбранных метрик.

5) Выбор метрик для последующей оценки качества моделей

По-моему мнению следует использовать метрики F1-score и recall для оценки точности бинарной классификации

F1-score как общую метрику recall - как наиболее полезную

Полезность recall исходит из поставленной задачи: "Присылать ли покупателю рассылки по почте" для выявления клиентов нам важнее отправить письмо клиенту которому оно не нужно нежели не отправить письмо с рассылкой клиенту которому оно было нужно

6) Выбор наиболее подходящих моделей

Стоит опробовать простые модели классификации:

- Решающее дерево
- KNeighborsClassifier

Попробовать ансамбль без сложной реализации:

- Случайный лес

Попробовать библиотеки бустинга:

- catboost

Попробовать стэкинг

7) Формирование обучающей и тестовой выборки на основе исходного набора данных. Построение базового решения

Разделим данные на обучающую валидационную и тестовую выборки

Из результатов обучения, видно что оверсемплинг, подбор гипер параметров, кросс валидация, дали ощутимый прирост метрик практически всем моделям baseline

Наилучший результат был получен с помощью стекинга KNN и CatBoost
